

Press Release

Telecommunication operators are realizing the benefits of integrating the fraud and credit management functions

27th November 2006: More and more telecommunication operators are realizing the benefits of integrating their fraud and credit management functions. The benefits are numerous, comprising increased efficiency, reduction in the cost of integration and ongoing maintenance of interfaces and reduction in overall hardware costs.

Neural Technologies (Nt) is the first company to supply a joint fraud and credit management software solution to the industry. The company installed its Minotaur™ Fraud & Credit Management Solution at Danish operator TDC last year, and it is currently installing it within one of Europe's largest GSM operators (name to be announced shortly).

Luke Taylor, Nt's Commercial Director, stated, "Merging these crucial risk management functions allows operators to streamline their efforts in reducing revenue losses. It's a logical step for telecommunication operators, especially given that the delineation between fraud and bad debt is often blurred. It provides them with many benefits, not least, substantial reduction in the duplication of effort, greater visibility of the status of individual subscribers and an overview of their total exposure to risk".
