Sylantro Systems Announces Synapps Server

New Web Services API Platform to Marry Voice to the Web, Enabling Innovative Voice Applications and Services, Mobility and Multimedia Collaboration

Spring 2007 VON, March 20, 2007 – Sylantro Systems Corp., the leading supplier of application feature servers for hosted VoIP services in carrier networks, today announced that based on the success of the Sylantro Synapps Web Services Interface launch in 2006, the company is taking Synapps to the next level by launching the Sylantro Synapps Server, a Web Services API platform that dramatically reduces the time-to-market for carriers to create and deliver value-added services.

The Synapps Server, in conjunction with Sylantro's Synergy Application Feature Server, allows service providers to deliver rich and innovative services for business and consumer markets without compromising reliability and scale for their mobile and fixed-line subscriber base. New hosted services are being created at a rapid rate on the Internet today - Synapps Server enables the coupling of voice services with these hosted applications, providing distinctive opportunities for addressing new markets and aligning with unique vertical markets.

Synapps Server provides carriers with two primary benefits. First, by leveraging open Web standards for developing new voice applications, carriers are able to tap into powerful Web services, tools and a vibrant developer community on the Web to create unique, integrated application services for their subscribers. Secondly, carriers are able to separate their call processing core from their value-added services tier, making it easier to innovate without compromising core reliability. The result is additional revenue streams and reduced churn from new converged application services that can be launched in weeks vs. months.

Examples of these application services include:

- Seamless telephony integration with on-demand CRM integrations and hosted software-as-a-service platforms
- Voice-enabled desktop plug-ins for hosted collaboration services
- Web click-to-call applications with intelligent call routing to hosted contact centers
- Hosted speech-enabled applications that integrate with corporate phone directories
- Mobile applications that integrate voice communications with hosted location-based services, all leveraging a variety of other hosted on-demand services available on the Internet

“Sylantro has long been a proponent of an open, programmable platform enabling best-of-breed integrations within carrier networks,” said Marco Limena, president and CEO, Sylantro Systems. “Synapps Server now takes that concept to the next level by enabling an application collaboration environment, where developers can marry Web 2.0, mobile and multimedia applications. With Synapps Server, carriers now have the ability to tap into the same momentum and connect that innovation with revenue generation through their customer base.”

About Sylantro Systems Corp.

Sylantro Systems provides the premier software platform for business, consumer, and mobile hosted VoIP solutions. Sylantro allows network operators to rapidly deliver high value, high margin managed telephony services without the cost and complexity of today’s in house PBX and key systems, giving users new flexibility in their communication services. Sylantro customers include AT&T, Bandwidth.com, China Netcom, China Unicom, Covad, KT, StarHub, SunRocket, and Swisscom. Sylantro is headquartered in Campbell, Calif.
